

Nub Theory vs. Gender Determination

16.5 weeks is when male or female sex parts are usually completely formed on most babies. Sex develops differently on each baby at varying times, just as all adults have varying genitalia so do developing babies. 92% of all babies at 16+ weeks will give an accurate sex reading of male or female genitalia. However, a (Nub Theory) is completely different and most facilities do not explain what you are receiving when you go in for an early prediction. It is a (tubercle reading) and not a fully formed male or female sex part. These early predictions are based off the directional angle of the tubercle, which is what will develop into a male or female sex part during the morphing stage approx. 12-16 weeks. The tubercle readings should be done between 13 – 14.5 weeks they are approx. 85% accurate, so 85 out of 100 will be correct and approx. 15 out of 100 will be incorrect not showing a correct angle.

I give parents the information to base their decision on when choosing a session that will fit their needs the best. Some will come in early for a 2D Nub Theory and then come back @ 16+ weeks to confirm Gender before they start announcing or planning parties. Remember to choose the correct package when booking online. (A) 13 – 14.5 weeks Nub Theory – (B) 16+ weeks Gender Determination both packages are \$69.00
